

RUGGED, WATERPROOF, NAVIGATION DEVICE WITH TOUCH PANEL

Field of the Invention

5 The present invention relates generally to navigational devices, and in particular to navigational devices which are both waterproofed and ruggedized.

Background of the Invention

A natural progression in devices is to build more function or even to
10 combine more functions into one device. In the past ten years, for example, mobile communications, personal data assistants, and portable navigational devices have become very popular. These devices have moved from desktop computers to hand-held devices. Personal data assistants ("PDA") are also exceedingly popular. The first PDA-type devices merely held a listing of contacts and may have had a calendar
15 function. Now PDAs, in addition to holding contact data and a calendar, hold e-mail. PDAs have now been provided with the capability to respond to e-mail and are linked or synchronized with a computer periodically so any e-mail answers can be ported over to a computer for sending. Calendar changes are also synchronized.

Navigational devices represent yet another technology that has boomed as of
20 late and which is now becoming popular and affordable. Previously, navigational devices were expensive and far from portable or hand-held. Most navigational devices could only be found on ships and airplanes. Now, navigational devices are popular options in luxury cars and navigational devices have become popular with outdoors people of all types. Fisherman have them to mark out their favorite fishing
25 holes, for example. These devices have also been combined with other devices, such as depth finders or fish finders which are popular with anglers.

Recently, PDAs and navigational devices, such as global positioning systems ("GPS"), have been combined. There are problems with such combined devices.

For example, current combination devices which include a PDA and a GPS are confusing to use. One of the more confusing aspects is switching between the software applications needed for the GPS and the software applications needed for the PDA.

5 When navigational devices or PDAs were first introduced, problems associated with using these device outdoors were generally not contemplated. The cost and size of the navigational device all but prohibited one from using the navigational device outdoors. PDAs were generally used in office environments. Escaping to the outdoors generally meant leaving your PDA inside. Such devices
10 were not waterproofed and not ruggedized.

 The size reduction and lesser cost of the navigational devices and the combination navigational devices and PDAs now make outdoor use more common. As a result, the device must be ruggedized to accommodate outdoor use. The navigational device must be made waterproof as well as drop-resistant so that the
15 device can withstand the rigors associated with such use. A device that combines uses, such as a combination PDA and navigational device, must also be made waterproof and drop-resistant. Making these devices waterproof and drop-resistant also is necessary as many users do not exercise care when handling such devices. It seems that as the cost goes down, so does the amount of care one uses in handling a
20 device. Making such a device waterproof and drop-resistant will lessen the number of returns from users in the field. In addition, more rugged devices generally will have a market advantage. A consumer is more likely to pay a premium for a rugged, more dependable device.

25

Summary of the Invention

 The above mentioned problems of navigational devices are addressed by the present invention and will be understood by reading and studying the following specification. Apparatus, systems and methods are provided for portable navigation

devices which incorporate triangulation positioning functionality with a dead reckoning positioning functionality such that the device can continue to provide navigation related services in "urban-canyons" or indoors. Further, in some embodiments, the apparatus, systems and methods integrate triangulation
5 positioning functionality with other handheld device functionality, e.g. cell phone and/or PDA functionality, in a manner which is not cumbersome to handle or to use.

In one embodiment of the present invention, a portable, and/or handheld navigation device is provided. The navigation device includes a processor and a memory adapted to communicate with the processor. The memory is adapted to
10 store navigation related data, the navigation related data including cartographic data including a number of locations and data indicative of thoroughfares of a plurality of types connecting certain ones of the locations. The device includes a housing having an opening. A touch panel is mounted in the opening of the housing. The touch panel and housing forming a substantially waterproof enclosure. A navigation
15 component is located within the substantially waterproof enclosure. The electronic device may also be multi-functional and, in some embodiments, includes cell phone or PDA capabilities.

A typical touch panel, in a hand-held electronic device, has a rigid material layer and a flexible layer. The rigid material layer and flexible material layer are
20 held together in spaced relation by a gasket of double adhesive tape. A major surface of the rigid material and a major surface of the flexible material are provided with an electrically conductive film so that when the flexible material is deflected to touch the rigid material a closed circuit indicating the location of the contact is formed.

25 In the invention, a mounting member circumscribes the opening in the housing. The mounting member has a pocket for holding an adhesive. The adhesive is applied about the periphery of the touch panel. In one embodiment the adhesive is a flexible adhesive. In other embodiments the adhesive is rigid. Either

adhesive may be curable using an ultraviolet light. In some embodiments, the handheld electronic device is provided with a shock absorbing member, such as a layer of foam or other viscoelastic material. In still other embodiments, the device includes a backing member that fits within the housing. The backing member has a portion positioned near the layer of rigid material of the touch panel. The shock absorbing member includes a portion which is sandwiched between the backing member and the layer of rigid material of the touch panel. In some embodiments, the shock absorbing member also includes a portion which is sandwiched between the flexible member of the touch panel and the mounting member. The mounting member is molded with or integral with the housing. In still other embodiments, a fluid seal is also provided. The fluid seal can include a gasket.

Advantageously, the invention provides for a device which can now be used outdoors. Even though all uses will not be outdoors, all users will benefit by having a more dependable, rugged device. The navigational device is waterproof. The touch panel and more specifically, the rigid portion of the touch panel, typically made of glass or plastic is more drop-resistant so that the device can withstand the rigors associated with outdoor use. Since the devices are waterproof and drop-resistant, the consumer market will perceive the device as more rugged and reliable and consumers will be more likely to pay a premium for the device. The number of returns from users in the field will also be less since the device is waterproof and drop-resistant.

These and other embodiments, aspects, advantages, and features of the present invention will be set forth in part in the description which follows, and in part will become apparent to those skilled in the art by reference to the following description of the invention and referenced drawings or by practice of the invention. The aspects, advantages, and features of the invention are realized and attained by means of the instrumentalities, procedures, and combinations particularly pointed out in the appended claims.

Brief Description of the Drawings

Figure 1 is a representative view of a Global Positioning System (GPS);

Figure 2A illustrates a front view of an embodiment of a hand-held, electronic device that includes a navigation component;

5 Figure 2B illustrates a end of the embodiment of a hand-held, electronic device shown in Figure 2A;

Figure 2C illustrates a top view of an embodiment of a hand-held, electronic device shown in Figure 2A;

Detailed Description of the Invention

15 In the following detailed description of the invention, reference is made to the accompanying drawings which form a part hereof, and in which is shown, by way of illustration, specific embodiments in which the invention can be practiced. The embodiments are intended to describe aspects of the invention in sufficient detail to enable those skilled in the art to practice the invention. Other embodiments
20 can be utilized and changes can be made without departing from the scope of the present invention. The following detailed description is, therefore, not to be taken in a limiting sense, and the scope of the present invention is defined only by the appended claims, along with the full scope of equivalents to which such claims are entitled.

25 The following description and figures use a reference numeral convention where the first digit of the reference numeral corresponds to the figure and the following two digits correspond to like elements throughout the specification. For example, the housing of a portable, hand-held, electronic device of the present

invention has a reference number of 212, 312, 412, 512 etc., corresponding to the housing X12 in Figures 2, 3, 4, 5, etc. where X is the number of the figure in which the reference numeral appears.

One type of navigational system includes Global Positioning Systems (GPS).

- 5 Such systems are known and have a variety of uses. In general, GPS is a satellite-based radio navigation system capable of determining continuous position, velocity, time, and in some embodiments, direction information for an unlimited number of users. Formally known as NAVSTAR, the GPS incorporates a plurality of satellites which orbit the earth in extremely precise orbits. Based on these precise orbits, GPS
10 satellites can relay their location to any number of receiving units.

- The GPS system is implemented when a device specially equipped to receive GPS data begins scanning radio frequencies for GPS satellite signals. Upon receiving a radio signal from a GPS satellite, the device can determine the precise location of that satellite via one of different conventional methods. The device will
15 continue scanning for signals until it has acquired at least three different satellite signals. Implementing geometrical triangulation, the receiver utilizes the three known positions to determine its own two-dimensional position relative to the satellites. Additionally, acquiring a fourth satellite signal will allow the receiving device to calculate its three-dimensional position by the same geometrical
20 calculation. The positioning and velocity data can be updated in real time on a continuous basis by an unlimited number of users.

- In fact, although GPS enabled devices are often used to describe navigational devices, it will be readily appreciated that satellites need not be used at all to determine a geographic position of a receiving unit, since cellular towers or any
25 customized transmitting radio frequency towers can be deployed and combined in groups of three or more. With such a configuration, any standard geometric triangulation algorithm can be used to determine the exact location of the receiving unit. In this way, personal hand-held devices, cell phones, intelligent appliances,

intelligent apparel, and others can be readily located geographically, if appropriately equipped to be a receiving unit.

Figure 1 shows one representative view of a GPS denoted generally by reference numeral 100. A plurality of satellites 120 are in orbit about the Earth 124.

5 The orbit of each satellite 120 is not necessarily synchronous with the orbits of other satellites 120 and, in fact, is likely asynchronous. A device that includes a GPS receiver 140 of the present invention is shown receiving spread spectrum GPS satellite signals 160 from the various satellites 120.

The spread spectrum signals 160 continuously transmitted from each satellite
10 120 utilize a highly accurate frequency standard accomplished with an extremely accurate atomic clock. Each satellite 120, as part of its data signal transmission 160, transmits a data stream indicative of that particular satellite 120. It will be appreciated by those skilled in the relevant art that the Device that includes a GPS receiver 140 must acquire spread spectrum GPS satellite signals 160 from at least
15 three satellites 120 for the Device that includes a GPS receiver 140 to calculate its two-dimensional position by triangulation. Acquisition of an additional signal 160, resulting in signals 160 from a total of four satellites 120, permits Device that includes a GPS receiver 140 to calculate its three-dimensional position.

Of course as previously presented and as is readily appreciated by those
20 skilled in the art, GPS satellites and GPS receiving devices are not required by the tenets of the present invention, since any receiving device capable of receiving the location from at least three transmitting locations can perform basic triangulation calculations to determine the relative position of the receiving device with respect to the transmitting locations.

25 For example, at least three cellular towers can each transmit their location information to a receiving cellular phone, or any other receiving device, and if the phones or devices are equipped to perform the triangulation algorithm, then the location of the cellular phone or device can be readily resolved. By further way of

example, an amusement park or entertainment facility can deploy three or more transmitting radio frequency devices and provide users with receiving units capable of performing a triangulation algorithm to determine the receiving units location within the amusement park or entertainment facility. In this way, it is readily
5 apparent that a receiving unit need not be exclusively GPS enabled to benefit from the teachings of the present invention.

Figure 2A illustrates a front view of an electronic navigational device 210 according to the teachings of the present invention. Figure 2A illustrates the top surface of the navigational device 210. In some embodiments, the navigational
10 device 210 shown in Figure 2A can include other functions, such as a personal digital assistant ("PDA") computing capability or cellular transceiver. The GPS navigational device 210 operates with an operating system ("OS") such as, for example, the well-known Palm or Pocket PC operating systems, the lesser-used Linux OS or a proprietary OS. The hand-held, electronic, navigational device 210
15 includes a housing 212 having an opening 214 therein. Within the housing 212 is a GPS patch antenna 216 (which is shown in phantom in Figure 2A). In the embodiment shown in Figure 2A, the antenna includes a patch antenna located on a top portion of the display. The housing 212 is generally rectangular with a low profile and has a display 200 viewable through the opening 214. A touch panel 220
20 is positioned within the opening 214. The touch panel 220 is transparent. the touch panel 220 is mounted within the opening and the display 200 is viewable through the touch panel 220 and the opening 214. The touch panel 220 is touch sensitive and can be responsive to a user's digit or a stylus. It should be noted that the display 200 is not limited to any particular type of display. The housing 212 has a first end
25 222 and a second end 224. The navigational device 210 includes a number of control buttons, or input keys 228 positioned toward one edge or end 224. The invention, however, is not so limited by the position of the control buttons 228. It should be noted that the input keys 228 can be positioned toward another edge or at any other

suitable location on the housing 212. The housing may have various slots, jack openings, and could be provided with cards for various purposes. The openings or slots provided are assembled within the housing so as to eliminate potential leakage paths. On another edge or end 225 of the housing 212 there is an infrared data port 5 235 ("IRDA"). In the embodiment shown in Figure 2A, the IRDA is positioned within a molded opening in the housing 212 and covered with a data port cover 236.

Also attached to the exterior of the housing 212 is a molded plate 230. The plate 230 includes an inclined surface 232 which engages a corresponding slot of a receptacle (not shown). The receptacle may be attached to the dashboard of a 10 vehicle. The plate 230 slips within a corresponding slot of the receptacle to temporarily mount the housing 212 to the dashboard. The circular shape of the plate 230 allows the user to turn the device 210 to any desired position so that the user can more easily view the display 200, reach the control buttons 228, or actuate the touch panel 220. The receptacle engages the plate 230 with sufficient force to retain the 15 hand-held, electronic device 210 in position during operation of the vehicle. In other words, the receptacle will hold the hand-held, electronic device 210 as the vehicle vibrates during normal operation or encounters bumps. The user can remove the hand-held, electronic device 210 when the vehicle is not in use. This lessens the potential that thieves may break into the vehicle to steal the hand-held, electronic 20 device 210. Furthermore, in some embodiments, the hand-held, electronic device 210 is operable when hand-held so that the user may use the hand-held, electronic device 210 in another vehicle or while outdoors in a rural or in an urban area. Some embodiments of the device 210 include batteries.

It should be understood that the structure shown is of a navigational unit 25 having a GPS. Other physical features and functionality, such as a cellular telephone, or a PDA, could be included with the GPS navigational device and are contemplated as within the scope of this invention.

Figure 2B illustrates an end of the embodiment of a hand-held, electronic device 210 shown in Figure 2A. The housing 212 includes a first half 211 and a second half 213. The opening 214 for the display 200 is in the second half 213 of the housing 212. The touch panel 220 is mounted within the opening 214. The first half 211 and the second half 213 are sealed with respect to one another. Also shown in Figure 2B is a sealed two position power switch 240 in the first half 211 of the housing 212. The power switch 240 is sealed so that moisture on the exterior surface of the housing 212 does not leak into the interior of the housing. The opening associated with the power switch is molded within the housing 212 and specifically within the first half 211 of the housing 212 to prevent a leakage path from the exterior to the interior of the housing.

Figure 2C illustrates a top view of an embodiment of a hand-held, electronic device 210 shown in Figure 2A. Again, Figure 2C illustrates that the housing 212 includes a first half 211 and a second half 213. The openings 214 for the touch panel 220 and the display 200 are in the second half 213 of the housing 212. The control buttons 228 are also in the second half 213 of the housing 212. The first half 211 of the housing 212 includes a splash proof data card door 250. The splash proof data card door 250 seals with respect to the housing 212. The splash proof data card door 250 covers a slot for receiving a data card, such as compact flash, smart media, secure digital, or any other data source. The data card is used to store instruction sets for the electronics within the interior of the housing 212. The data card slot (not shown) is covered by the data card door 250 to prevent a leakage path to the interior of the housing 212. That is, the splash proof data card door 250 is sealed with respect to the first half 211 of the housing 212 to keep the hand-held, electronic device 210 waterproof.

Figure 2D illustrates an isometric perspective view of an embodiment of a hand-held, electronic device 210 shown in Figures 2A-2C. The isometric view of the hand-held, electronic device 210 shows the positioning of the power switch 240,

the splash proof data card door 250, the control buttons 228, the touch panel 220, the IRDA port 235 and the plate 230. It should be noted that the position of these various components can shift and still be within the scope of this invention.

Figures 3-9 are provided as illustrative examples of hardware embodiments for a portable, hand-held, electronic device that includes a navigational device according to the teachings of the present invention. It should be appreciated that other suitable designs for a hardware device would also be within the scope of the present invention.

Figure 3 illustrates a cross-sectional view along line 3-3 in Figure 2 of the hand-held electronic device 310. The portable hand-held electronic device 310 includes a housing 312 having an opening 314 in a second half 313 of the housing 312. The hand-held device has a touch panel 320 which is mounted and viewable through the opening 314. The touch panel 320 is transparent. The device 310 includes a display 300 mounted within the housing 312 and viewable through the touch panel 320. The housing also includes a patch antenna 316 which is positioned therein. In the embodiment shown in Figure 3, the patch antenna 316 is positioned along a top surface of the display 300. That is, the patch antenna 316 is positioned so that it is substantially horizontal with the plane of the earth when mounted within a vehicle using a plate 330. As will be understood by one of ordinary skill in the art upon reading this disclosure, the patch antenna 316 includes a GPS patch antenna 316 (which is communicatively coupled to a GPS receiver as described further in connection with Figure 12). Also included within the housing 312 is an internal rate gyro 390 or other suitable dead-reckoning component. The internal rate gyro 390, or other suitable dead reckoning component supplements and/or complements GPS positioning service provided through use of the GPS patch antenna 316 when GPS satellite signals are degraded, interrupted, or otherwise obstructed.

Along the edge of the opening 314 is a mounting apparatus 340. The mounting apparatus 340 circumscribes the edge of the opening 314. The mounting

apparatus 340 includes a first pocket 341 and a second pocket 342. The two pockets 341 and 342 form a first leg 344 and a second leg 345 which extend away from the front face or top of the housing 312 and specifically made integral with the second half 313 of the housing 312. The mounting apparatus 340 is molded with the rest of the housing 312 or made integral with the rest of the housing 312. The mounting apparatus is used to make a watertight seal around the touch panel 320. The mounting apparatus can also be used to provide a shock mount for the touch panel 320. The shock mount will be further detailed in Figures 7 and 8. The waterproof aspects of the mounting apparatus 340 will be further detailed in Figures 7-10.

Also included within the housing 312 is a backing bracket or backing plate 350. The backing bracket or backing plate 350 is mounted to the second half 313 of the housing 312 and is positioned near the edge of the touch panel 320. The backing plate has an opening 352 therein so that the backing plate 350 essentially forms a frame around the edge of the touch panel 320 to support the edge of the touch panel 320. The backing plate 350 is typically made of sheet metal, although it should be noted that other materials can be used in order to form the backing plate 350. In the embodiment shown in Figure 3, the backing bracket or backing plate 350 fastens the touch panel 320 to a second half 313 of the housing 312.

Figure 4 illustrates a cross-sectional view along line 4-4 in Figure 2 of the hand-held electronic device 410. More specifically, Figure 4 shows a cross sectional view of a second half 413 of the housing 412. Figure 4 illustrates more clearly the mounting of the touch panel 420. A complete first half 411 of the housing 412 is not shown in Figure 4 for the sake of clarity. The hand-held electronic device 410 includes the second half 413 of the housing 412 that has an opening 414 therein. The portable electronic hand-held device 410 also includes a touch panel 420. A mounting device or mounting apparatus 440 circumscribes the opening 414 and is used to mount the touch panel 420 within the opening 414 of the housing 412 so that it is viewable through the opening 414 while being waterproof. In some

embodiments, the backing bracket or backing plate 450 fastens to the second half 413 of the housing 412. In some embodiments, the mounting apparatus 440 can include a shock mount portion. Situated near an interior major surface of the touch panel 420 is a backing plate 450. The backing bracket or backing plate 450 is typically made of sheet metal and includes an opening 452 therein. The backing bracket or backing plate frames the touch panel 420 on the interior side of one of the major surfaces of the touch panel 420. The backing bracket or backing plate 450 frames the touch panel 420 along the periphery of the touch panel 420 and provides support around the edges of the touch panel. The backing bracket or backing plate 450 is mounted to the second half 413 of the housing 412 via fasteners 415. In one embodiment, the fasteners include screws, or other suitable fasteners or the like. Also included within the housing 412 is a patch antenna. Although the patch antenna is not visible in Figure 4, the patch antenna is operatively coupled to a printed circuit board which includes a microprocessor and a memory. Computer-executable instruction sets may be stored within the memory. The instruction set is used by the microprocessor to perform various calculations including route calculations. The patch antenna is operatively coupled to the microprocessor and the memory (as described in greater detail in connection with Figure 12) so that the patch antenna can acquire signals from GPS satellites or other positioning signals, such as RF signals and the like, to determine the location of the hand-held, portable electronic device 410. It is noted here, that as discussed further in Figures 11 and 12 below, the electronic components of the present invention include a cellular transceiver and/or additional transceiver operable to wireless transmit and receive signals.

25 The patch antenna, cellular transceiver, and/or additional transceiver can also be used to receive all or a portion of the above described computer executable instruction sets from a remote server or other communication device. In other words, in some embodiments the instruction set can be housed within the onboard

microprocessor and onboard memory, and in other applications, some or all of the instruction sets may be forwarded to the onboard microprocessor and onboard memory. Further details are discussed with respect to Figure 13.

Figure 5 is a front cutaway view of the hand-held, electronic device 510 as shown in Figures 2-4. The portable, hand-held electronic device includes a housing 512. Attached to the housing 512 is the backing bracket or backing plate 550. The backing bracket has an opening therein 552. The backing bracket 550 is attached to the housing using fasteners 515. Also located within the housing is a patch antenna 516.

Figure 6 is a cross-sectional view of a typical touch panel 620 of the hand-held, electronic device. The touch panel 620 includes a thin, flexible film 622 which is positioned near a layer of rigid material 624. The thin film 622 and the rigid material 624 each have a layer of conductive material 630, 632, respectively, such as indium, tin, oxide printed on a major surface. When thin film 622 is deflected, the conductive material 632 touches the conductive material 630 to create a closed circuit. It should be noted that the touch panel 620 is not limited to the type of conductive film placed on the thin, flexible film 622 or the rigid material 624. A touch panel with any type of conductive film is contemplated by the invention. The layer of rigid material 624 is typically more rigid than the housing 212, 312, 412, 512 of the portable electronic device 210, 310, 410, 510. The thin, flexible film 622 is attached to the rigid backing layer 624 by an adhesive gasket 626. The adhesive gasket 626 keeps the thin, flexible film 622 separated from the rigid backing 624 of the touch panel 620. The rigid backing can be made of plastic or glass. Other materials can also be used. Glass seems to be the most commonly used rigid material 624. Therefore, the rigid material 624 needs to be shock-mounted with respect to the housing 212, 312, 412, 512, so that the portable, electronic, hand-held device 210, 310, 410, 510 is more rugged. The touch panel 220, 320, 420, 520, 720, 820, 920 shown in Figures 2-5, as well as in Figures 7-9, each have a similar

structure as shown in Figure 6. However for the sake of simplicity the touch panel 220, 320, 420, 520, 720, 820, 920, is merely shown as one solid block of material in Figures 2, 3, 4, 5, 7, 8 and 9. It should be noted, however, that even though the touch panel is shown as a solid block of material, it is actually a rigid backing 624 with a thin, flexible film 622 held away from the rigid backing by the adhesive gasket 626. By applying pressure to the touch panel with either a fingertip or a stylus, inputs and commands can be made to the portable electronic device. As mentioned previously, a major surface of the rigid material and a major surface of the flexible material are provided with an electrically conductive film so that when the flexible material is deflected to touch the rigid material a closed circuit indicating the location of the contact is formed.

Figure 7 is a cross-sectional view of a portion of the housing near the opening which details one embodiment for mounting the touch panel 720 with respect to the housing 712. The housing 712 includes the mounting apparatus 740. The mounting apparatus 740 includes a first pocket 741 and a second pocket 742. The mounting apparatus 740 includes a first leg 744 and a second leg 745. As shown in Figure 7, the touch panel 720 is shock-mounted using a first viscoelastic shock mount member 760 and a second viscoelastic shock member 762. The first viscoelastic shock member 760 is sandwiched between an edge of the touch panel 720 and a portion of the first leg 744 and a portion of the second leg 745. As shown in Figure 7, the bottom portion of the second leg 745 of the mounting apparatus is entirely covered to sandwich the first viscoelastic member 760 between the two legs 744, 745 of the mounting apparatus and the edge of the display 720. The second viscoelastic member 762 is sandwiched between the backing member 750 and the edge of the touch panel 720. The viscoelastic members 760, 762 can be made from a variety of materials, including foam tape which may have an adhesive backing. The viscoelastic elements or members 760, 762 can extend all the way around the periphery of the touch panel 720. It is not necessary, however, to have the

viscoelastic members 760, 762 extend all the way around the periphery of the touch panel 720 in order to obtain an adequate shock mount to increase the drop resistance of the portable, hand-held, electronic device 210, 310, 410, 510.

Within the pocket 741 is a flexible adhesive 770. The flexible adhesive 770
5 fills the pocket 741 and can cover a portion of a major surface 721 of the touch panel and covers an edge 722 of the touch panel 720. The flexible adhesive 770 provides a moisture barrier which prevents moisture from passing from the exterior portion of the touch panel 720 to the interior of the housing 712. The flexible adhesive also serves as a shock mount. During a drop or other shock event, the
10 flexible adhesive 770 flexes and cradles the edge of the touch panel 720. The flexible adhesive 770 is typically silicon and preferably is a room-temperature vulcanization ("RTV") silicon. It is important that the adhesive fill the entire pocket 741 around the whole periphery of the touch panel 720 and about the periphery of the mounting apparatus 740 near the opening 714 in the housing 712. In other
15 words, the flexible adhesive 770 provides a moisture barrier around the entire edge of the touch panel 720 to prevent a leakage path from forming between the exterior surface of the touch panel 720 and the interior of the housing 712. Thus, the mounting apparatus 740 shown in Figure 7 includes a flexible adhesive 770 which wraps around a portion of the major surface 721 of the display as well as the edge
20 722 of the touch panel 720. This flexible adhesive 770 goes around the entire periphery of the display and provides a moisture barrier to prevent leakage paths between the exterior surface of the touch panel 720 and the exterior of the housing 712 and the interior of the housing 712. The flexible adhesive 770 also acts as a shock mount, since the flexible adhesive flexes during a shock event or a drop. In
25 addition, the mounting apparatus 740 includes a first viscoelastic pad 760 and a second viscoelastic pad 762. These can also ring the entire circumference or outer perimeter of the touch panel 720. It should be noted that the viscoelastic elements

760, 762 do not necessarily have to go all the way around the periphery of the display in order to be effective as shock mounts.

The touch panel 720 is mounted between the mounting apparatus 740 and the backing bracket 750. The touch panel 720 is transparent. Mounted within the housing 712 is display 700. The display 700 is viewable from the exterior of the housing 712 through the transparent touch panel 720.

Figure 8 is a cross-sectional view of a portion of the housing 812 near the opening 814 in the housing, which details another embodiment for mounting the touch panel 820 with respect to the housing 812 in the hand-held, electronic device 810. Near the opening 814 is a mounting apparatus 840 which includes a first pocket 841 and a second pocket 842. The pockets 841 and 842 result in a first leg 844 and a second leg 845. The legs 844 and 845 contact a major surface 821 of the touch panel 820. The major surface 821 corresponds to the portion of the touch panel 820 which is also exterior to the internal portion of the housing 812. Another major surface 823 faces the interior of the housing 812. A viscoelastic member 862 is sandwiched between a major surface 823 of the touch panel 820 and the backing bracket 850 which is mounted to the interior of the touch panel 820. The viscoelastic member 862 serves as a shock mount since the touch panel 820 typically includes a fragile or rigid element, such as a glass layer. The pocket 841 is filled with a flexible adhesive 870. The adhesive 870 also serves a shock absorbing function. The adhesive 870 can cover a portion of the major surface 821 of the touch panel 820 as well as the edge 822 of the touch panel 820. The flexible adhesive 870 is a silicon adhesive and produces a water barrier or moisture barrier between the interior of the housing 812 and the exterior of the housing 812 and touch panel 820. Therefore, the pocket 841 of the mounting apparatus 840 extends all the way around the edge of the touch panel 820 to prevent any leakage path from the exterior of the housing 812 to the interior of the housing. The viscoelastic member 862 may also extend completely around the circumference of the touch

panel 820, or it may pass around certain portions at the circumference of the touch panel 820. The viscoelastic member 862, as well as the flexible adhesive 870, dampen any shock that may result from a drop or other shock event that may occur with respect to the housing 812 of the portable, hand-held, electronic device 810.

5 The viscoelastic layer 862 can be any sort of material including a flexible tape or a foam tape that has an adhesive backing. The flexible adhesive 870 typically is a silicone and preferably, but not limited to, a RTV silicone, which vulcanizes at room temperature.

The touch panel 820 is mounted between the mounting apparatus 840 and
10 the backing bracket 850. The touch panel 820 is transparent. Mounted within the housing 812 is display 800. The display 800 is viewable from the exterior of the housing 812 through the transparent touch panel 820.

Figure 9 shows yet another embodiment of the mounting apparatus for mounting the touch panel 920 with respect to the housing 912 of the hand-held,
15 electronic device 910. In this particular hand-held, electronic device 910 there is no backing member such as that shown in Figure 2, 3, 4, 5, 7, and 8. In this particular instance, the mounting apparatus 940 includes a first pocket 941. There is no second pocket. Rather, the volume the mounting apparatus between a first leg 944 and a second leg 945 is solid plastic. A rigid adhesive 971 is placed in the pocket
20 941. The area between and including first leg 944 and the second leg 945 contact the major surface 921 of the touch panel 920 which includes an exterior portion. In this embodiment, this contact surface is maximized to evenly distribute any shock or force the touch panel 920 may experience. The rigid adhesive 971 is placed in the pocket. The rigid adhesive contacts the outside edge 922 of the touch panel 920.
25 The rigid adhesive is preferably UV-cured so that it can be cured during manufacture. The rigid adhesive 971 then grips or holds the touch panel 920 by the portion contacting the major surface 921 and by the outside edge 922 of the touch panel 920. In this particular embodiment, the idea is to rigidly hold the touch panel

920 in place so that if a shock event should occur, there is relatively little if any motion between the touch panel 920 and the mounting apparatus 940 and the housing 912 of the hand-held, electronic, portable device 910. The rigid adhesive 971 which is in the pocket 941 is continuous around the lip or outer edge of the touch panel and provides a moisture barrier to prevent leakage from the exterior to the interior of the housing 910.

The touch panel 920 is mounted to the mounting apparatus 940. The touch panel 920 is transparent. Mounted within the housing 912 is display 900. The display 900 is viewable from the exterior of the housing 912 through the transparent touch panel 920.

It should be noted that there may be additional moisture barriers put in place in addition to any of the adhesive barriers that are shown in Figures 7, 8, and 9. For example, a gasket could be placed on either of the first legs 844, 944 so that the gasket is sandwiched between the first leg 844, 944 and the touch panel 820, 920. Similarly, a gasket could be placed on the second leg 745, 845, 945 so that it is sandwiched between the bottom of the leg and the touch panel 720, 820, 920.

Figure 10 is another embodiment of the mounting apparatus 1040 for mounting the touch panel 1020 with respect to the housing 1012 of a hand-held electronic device 1010. In this particular hand-held, electronic device 1010, a C-shaped gasket 1090 wraps around three surfaces of the edge of the touch panel 1020. The C-shaped gasket 1090 wraps around the edge 1022 of the touch panel 1020 and also contacts a portion of the first major surface 1021 and a portion of the second major surface 1023 of the touch panel 1020. The mounting apparatus 1040 is essentially a solid piece of plastic having a pocket 1041 therein. A portion of the C-shaped gasket 1090 fits within the pocket 1041 in the mounting member 1040. A backing bracket 1050 is also provided. The backing bracket 1050 compresses the gasket 1090 in a first direction. The touch panel 1020 is sized so that the gasket 1090 is also compressed in a second direction towards the housing 1012. In

operation, no glue or adhesive is required to shock mount the touch panel 1020 and form a waterproof seal. The gasket 1090, when compressed by the outer edge 1022 of the touch panel 1020 and by the backing bracket 1050, provides both a shock mount and a water proof seal. The touch panel 1020 is mounted between the mounting apparatus 1040 and the backing bracket 1050. The touch panel 1020 is transparent. Mounted within the housing 1012 is a display 1000. The display 1000 is viewable from the exterior of the housing 1012 through the transparent touch panel 1020.

Figure 11 is a block diagram of one embodiment for the electronic components within the hardware of Figures 2A-2D, such as within housing 212 and utilized by the electronic navigational device. In the embodiment shown in Figure 11, the electronic components include a processor 1110 which is connected to an input 1120, such as keypad, touch panel or infrared data acquisition port via line 1125. It will be understood that input 1120 can alternatively be a microphone for receiving voice commands. Processor 1110 communicates with memory 1130 via line 1135. Processor 1110 also communicates with display screen 1140 via line 1145. An antenna/receiver 1150, such as a GPS antenna/receiver is connected to processor 1110 via line 1155 and is employable for providing triangulation positioning functionality. It will be understood that the antenna and receiver, designated by reference numeral 1150, are combined schematically for illustration, but that the antenna and receiver may be separately located components, and that the antenna may be a GPS patch antenna or a helical antenna. The electronic components of shown in Figure 11 include a transceiver 1160 which is coupled to the processor 1110 via line 1165. The electronic components include I/O ports 1170 connected to processor 1110 via line 1175. The I/O ports 1170 can include but are not limited to serial, digital, discrete, optoelectrical, or other I/O ports. The electronic components further include at least one dead reckoning component 1180 operable to provide dead reckoning positioning functionality to the device and

connected to the processor 1110 via line 1185. According to the teachings of the present invention, the at least one dead reckoning component 1180 includes, by way of example and not by way of limitation, a rate gyro as the same are known and understood by one of ordinary skill in the art. Examples of such a dead reckoning positioning functionality include, but are not limited to, the dead reckoning positioning hardware and algorithms as described in commonly assigned applications entitled; "Portable Navigation Device with Integrated GPS and Dead Reckoning Capabilities," application serial number 10/184,844, and "Systems and Methods with Integrated GPS and Dead Reckoning Capabilities," application serial number 10/184,373, each of which is incorporated herein by specific reference. The invention, however, is not so limited. One of ordinary skill in the art will appreciate, upon reading this disclosure, that other dead reckoning components suited to provide the advantages of the present invention are considered equally within the scope of the present invention. As one of ordinary skill in the art will understand upon reading this disclosure, the dead reckoning functionality, according to the teachings of the present invention, is adapted to supplement the GPS or triangulation positioning functionality when the GPS positioning functionality is interrupted, degraded, or otherwise unavailable.

Figure 12 is a block diagram of another embodiment for the electronic components within the hardware of Figures 2A-2D according to the teachings of the present invention. In this particular embodiment, the electronics can include more than one function. One example of such a multifunctional device includes a device capable of a first function with global positioning and routing, and a second function, such as keeping addresses, calendars and files used for linking with another computer. The second function or set of functions are commonly associated with a personal data assistant ("PDA"). It should be noted that the second function could be a multitude of other functions and is not limited to the functions commonly associated with a PDA. For example, the other function could be a cellular phone,

or any other portable electronic computing device. It should be noted that the electronic device could also include more than two different functions. The electronic components shown in Figure 12 include a processor 1236 which is connected to the GPS antenna 1214 through GPS receiver 1238 via line 1241. The processor 1236 interacts with an operating system (such as PalmOS; Pocket PC) that runs selected software depending on the intended use of the electronics, such as software for driving a PDA functionality, cellular phone functionality, navigation functionality, or other hand held device application. Processor 1236 is coupled with memory 1242 (such as RAM, ROM, flash, molecular memory and the like) via line 1244, and power source 1246 for powering the electronic components. The processor 1236 communicates with a display, 1226 via data line 1248.

The electronic components further include several other input sources that are connected to the processor 1236. That is, control buttons and the touch panel 1228 are connected to processor 1236 via line 1251 and a map data cartridge 1233 inserted into cartridge bay 1232 is connected via line 1252. An I/O port 1254 is connected to the processor 1236 via line 1256.

In the embodiment shown in Figure 12, a cellular antenna 1216 is connected to a cellular transceiver 1258, which is connected to the processor 1236 via line 1266. Processor 1236 is connected to the speaker/headphone jack 1234 via line 1262. The multi-function electronic device may also include an additional transceiver 1260 (such as an infrared port, or Bluetooth transceiver) coupled to the processor 1236. As one of ordinary skill in the art will understand upon reading this disclosure, the additional transceiver can be used to transmit or "beam" information from one electronic device to another electronic device. The same will be explained in more detail below.

According to the teachings of the present invention, and as shown in the embodiments of Figures 11 and 12, the electronic components of the present invention include a memory, shown as 1242 in Figure 12, which is adapted to store

and/or house a set of executable instructions, programs, and/or program modules. For ease of illustration, the memory will be discussed in reference to Figure 12 where the memory 1242 is coupled to the processor 1236 via line 1244. The description, however, applies analogously to the memory 1130 in Figure 11. As one
5 of ordinary skill in the art will appreciate, the memory 1242 is adapted to communicate with the processor 1236. In the invention, the memory 1242 is further adapted to store or house navigation related data and is adapted to house or store software operable to perform routing algorithms. Examples of such routing algorithms include, but are not limited to, routing algorithms as described in
10 commonly assigned applications entitled; "Systems and Methods for a Navigational Device with Improved Route Calculation Capabilities," application serial number 10/028,057
6,545,637
now Patent, "Systems and Methods for a Navigational Device with Forced Layer
Switching Based on Memory Constraints," application serial number 10/027,159, now Patent
"Systems and Methods for a Navigational Device with Automated Next Turn Page," 6,581,003
15 application serial number 10/029,917, "Systems and Methods for a Navigational Device with Voice Guidance," application serial number 10/029,732, and "Systems and Methods for a Navigational Device with Detour Routing Capabilities," application serial number 10/028,343, each of which is incorporated herein in full by reference.

According to the teachings of the present invention, the navigation related
20 data includes cartographic data. The cartographic data includes a number of locations and data indicative of thoroughfares of a plurality of types connecting certain ones of the locations. In one embodiment, the navigation related data can include one or more calculated routes between at one or more of the number of locations. Further, according to the teachings of the present invention, the software
25 stored or housed within memory 1242 includes software operable to perform one or more applications for navigation. As used herein, software operable to perform one or more applications for navigation includes, but is not limited to, software operable to find points of interest. In one embodiment, the navigation related data includes

navigation data selected from the group of a number of waypoints, a planned route, and points of interest. In one embodiment, the points of interest include points of interest selected from the group of geographical points of interest, entertainment venues, dining venues, historical points of interest, and lodging venues. In one
5 embodiment, the navigation related data includes navigation data selected from the group of automobile navigation data, marine craft navigation data, pedestrian navigation data, and hiking navigation data.

In one embodiment, the device is GPS enabled. In this embodiment, the software is operable to calculate an estimated time of arrival of the device to the a
10 desired destination using an integrated GPS capability of the device.

According to the teachings of the present invention, and as shown in the embodiments of Figures 11 and 12, the electronic components of the present invention include a transceiver shown as 1260, which is coupled to the processor. For ease of illustration, the transceiver 1260 will be discussed in reference to Figure
15 12 where the transceiver 1260 is coupled to the processor 1236 via line 1261. The description, however, applies analogously to the electronic components shown in Figure 11. As stated above, the memory is adapted to store or house software. According to the teachings of the present invention, software is provided which includes a set of executable instructions, programs, and or program modules adapted
20 to control transceiver 1260 such that the transceiver 1260 can transmit and receive navigation data between a handheld electronic device and an other portable and/or handheld device. For example, in one embodiment, the software includes a set of executable instructions adapted to transmit and receive the navigation related data via a commercial communications network.

25 One example of a commercial communications network includes an analog cellular network using plain old telephone service (POTS). Another example of a commercial communications network to which the present invention is adapted includes a digital packet switched cellular network such as a personal

communications service (PCS) network. As one of ordinary skill in the art will understand upon reading this disclosure, the transceiver, 1160 and 1260 of the present invention is adapted to transmit and receive navigation related data via the Internet using Internet Protocol (IP). Thus, the present invention includes a
5 handheld electronic device which is adapted to transmit and receive navigation related data over a wide area network (WAN) using any number or combination of hardwired and/or wireless communication channels. For instance, the transceiver of the present invention is adapted to transmit and receive navigation related data using a wireless application protocol (WAP). However, as one of ordinary skill in the art
10 will understand upon reading and comprehending this disclosure, the invention is not limited to single one or particular combination of WAN communication channels or protocols. That is the transceiver can be instructed to transmit and receive navigation related data in a 3G GSM/CDMA network, and other networks of the like.

15 Similarly, according to the teachings of the present invention, the transceiver 1160 and 1260 is adapted to transmit and receive navigation related data over a local area network (LAN). In this embodiment, the transceiver 1160 and 1260 are adapted to operate in a short range network and wirelessly transmit and receive the navigation related data between a handheld electronic device and an other portable
20 and/or handheld electronic device using either infra-red signaling and/or a Bluetooth signaling technology as the same are known and understood by one of ordinary skill in the art. The invention is not so limited. As one of ordinary skill in the art will understand upon reading this disclosure, the electronic devices described herein include multipurpose devices, such as PDAs, cell phones and other intelligent
25 appliances/apparel of the like, which can wirelessly transmit navigation related data from one such device to another. That is, in one embodiment, according to the teachings of the present invention, the handheld electronic device includes devices selected from the group of cell phones, intelligent apparel, and PDAs. In one

embodiment, the other portable and/or handheld electronic device similarly includes devices selected from the group of cell phones, intelligent apparel, and PDAs.

According to the teachings of the present invention, and as shown in the embodiments of Figures 11 and 12, the electronic components of the present invention include a dead reckoning component shown as 1280 which is coupled to the processor 1110, 1230. For ease of illustration, the dead reckoning component 1180 and 1280 will be discussed in reference to Figure 12 where the dead reckoning component 1280 is coupled to the processor 1236 via line 1281. The description, however, applies analogously to the electronic components shown in Figure 11. As stated above, the memory is adapted to store or house software. According to the teachings of the present invention, software is provided which includes a set of executable instructions, programs, and or program modules adapted to control the dead reckoning component 1280 such that the dead reckoning component 1280 can be activated and provide navigation services to the device.

As identified herein, the present invention provides a portable electronic device which includes both a triangulation positioning and a dead reckoning positioning functionality. In one embodiment, the triangulation positioning functionality includes a GPS functionality and the dead reckoning functionality includes a rate gyro. Examples of such a triangulation positioning and a dead reckoning positioning functionality include, but are not limited to, the triangulation positioning and a dead reckoning positioning hardware and algorithms as described in commonly assigned applications entitled; "Portable Navigation Device with Integrated GPS and Dead Reckoning Capabilities," application serial number 10/184,844 and "Systems and Methods with Integrated GPS and Dead Reckoning Capabilities," application serial number 10/184,373, each of which has been incorporated herein by specific reference. The invention, however, is not so limited. In the invention, the processor of the device is adapted to operate on a set of computer executable instructions to determine, or resolve, a position of the device

when the triangulation positioning service and/or signals are available. The processor of the device further adapted to operate on the set of computer executable instructions to determine, or resolve, a position of the device using the dead reckoning functionality to supplement and/or complement the triangulation positioning functionality when the triangulation positioning functionality is interrupted, degraded, or otherwise unavailable. In this manner the present invention allows for the device to continue processing and/or tracking a location or position of the device when such triangulation positioning services are interfered with such as in "urban canyons" or when the device is indoors. Similarly, device can thus continue navigating a route for the device as the same is described herein.

As shown in Figures 11 and 12, the device further includes an input such as a touch panel, or touchscreen, in communication with the processor 1236 and the memory 1242, e.g. touch panel portion 1228 in Figure 12. According to the teachings of the present invention and as described above, a display 1248 is viewable through the touchscreen 1228 and is similarly in communication with the processor 1236 and the memory 1242 and operable for displaying cartographic data, a calculated route, and a location of the device. The display is adapted to display all or part of a "convergence" and/or a "solution." As used herein, the terms convergence and/or solution are intended to mean a complete path provided by the thoroughfares of a plurality of types connecting certain ones of the number of locations in the cartographic data.

Figure 13 is a block diagram of an embodiment of a navigation system according to the teachings of the present invention. The navigation system includes a server 1302. According to one embodiment, the server 1302 includes a processor 1304 operably coupled to memory 1306, and further includes a transmitter 1308 and a receiver 1310 to send and receive communication signals. The transmitter 1308 and receiver 1310 are selected or designed according to the communication requirements and the communication technology used in the communication design

for the navigation system. The functions of the transmitter 1308 and the receiver 1310 can be combined into a single transceiver.

The navigation system further includes a mass data storage 1312 coupled to the server 1302 via communication link 1314. The mass data storage 1312 contains
5 a store of navigation data. One of ordinary skill in the art will understand, upon reading and comprehending this disclosure, that the mass data storage 1312 can be separate device from the server 1302 or can be incorporated into the server 1302.

The navigation system further includes a navigation device 1316 adapted to communicate with the server 1302 through the communication channel 1318.

10 According to one embodiment, the navigation device 1316 includes a processor and memory, as previously shown and described with respect to the block diagrams of Figure 11 and 12. Furthermore, the navigation device 1316 includes a transmitter 1320 and receiver 1322 to send and receive communication signals through the communication channel 1318. The transmitter 1320 and receiver 1322 are selected
15 or designed according to the communication requirements and the communication technology used in the communication design for the navigation system. The functions of the transmitter 1320 and receiver 1322 can be combined into a single transceiver.

Software stored in the server memory 1306 provides instructions for the
20 processor 1304 and allows the server 1302 to provide services to the navigation device 1316. One service provided by the server 1302 involves processing requests from the navigation device 1316 and transmitting navigation data from the mass data storage 1312 to the navigation device 1316. According to one embodiment, another service provided by the server 1302 includes processing the navigation data
25 using various algorithms for a desired application, and sending the results of these calculations to the navigation device 1316.

The communication channel 1318 is the propagating medium or path that connects the navigation device 1316 and the server 1302. According to one

embodiment, both the server 1302 and the navigation device 1316 include a transmitter for transmitting data through the communication channel and a receiver for receiving data that has been transmitted through the communication channel.

The communication channel 1318 is not limited to a particular communication technology. Additionally, the communication channel 1318 is not limited to a single communication technology; that is, the channel 1318 can include several communication links that use a variety of technology. For example, according to various embodiments, the communication channel is adapted to provide a path for electrical, optical, and/or electromagnetic communications. As such, the communication channel includes, but is not limited to, one or a combination of the following: electrical circuits, electrical conductors such as wires and coaxial cables, fiber optic cables, converters, radio-frequency (RF) waveguides, the atmosphere, and empty space. Furthermore, according to various embodiments, the communication channel includes intermediate devices such as routers, repeaters, buffers, transmitters, and receivers, for example.

In one embodiment, for example, the communication channel 1318 includes telephone and computer networks. Furthermore, in various embodiments, the communication channel 1316 is capable of accommodating wireless communication such as radio frequency, microwave frequency and infrared communication, and the like. Additionally, according to various embodiments, the communication channel 1316 accommodates satellite communication.

The communication signals transmitted through the communication channel 1318 include such signals as may be required or desired for a given communication technology. For example, the signals can be adapted to be used in cellular communication technology, such as time division multiple access (TDMA), frequency division multiple access (FDMA), code division multiple access (CDMA), global system for mobile communications (GSM), and the like. Both digital and analog signals can be transmitted through the communication channel

1318. According to various embodiments, these signals are modulated, encrypted and/or compressed signals as can be desirable for the communication technology.

The mass data storage includes sufficient memory for the desired navigation application. Examples of mass data storage include magnetic data storage media such as hard drives, optical data storage media such as CD ROMs, charge storing data storage media such as Flash memory, and molecular memory. Moreover, as one skilled in the art will readily appreciate the mass storage need not be a single device as a plurality of storage devices can be logically associated to form a distributed mass storage device of the present invention.

10 According to one embodiment of the navigation system, the 1302 server includes a remote server accessed by the navigation device 1316 through a wireless channel. According to other embodiments of the navigation system, the server 1302 includes a network server located on a local area network (LAN), wide area network (WAN), a virtual private network (VPN) and server farms.

15 According to another embodiment of the navigation system, the server 1302 includes a personal computer such as a desktop or laptop computer. In one embodiment, the communication channel 1318 is a cable connected between the personal computer and the navigation device. According to one embodiment, the communication channel 1318 is a wireless connection between the personal
20 computer and the navigation device 1316.

Figure 13 presents yet another embodiment for a collective set of electronic components adapted to the present invention. As one of ordinary skill in the art will understand upon reading this disclosure, the navigation system of Figure 13 is adapted to the present invention in a manner distinguishable from that described and
25 explained in detail in connection with Figure 11 and 12.

The mass storage device 1312 connected to the server can include volumes more cartographic and route data than that which is able to be maintained on the navigational device 1316 itself. In this embodiment, the server 1302 processes the

majority of a user's travel along the route using a set of processing algorithms and the cartographic and route data stored in memory 1312 and can operate on signals, e.g. GPS signals, originally received by the navigational device 1316. Similar to the navigational device of Figures 2-12, the navigation device 1316 in system 1300 is
5 outfitted with a display 1324 and GPS capabilities 1326.

It should be noted that the electronic components of device shown in Figure 2-12 and components of the system 1300 shown in Figure 13 can be embodied as computer hardware circuitry or as a computer-readable program, or a combination of both. In another embodiment, system 1300 is implemented in an application service
10 provider (ASP) system.

More specifically, in the computer-readable program embodiment, the programs can be structured in an object-orientation using an object-oriented language such as Java, Smalltalk, C++, and others, and the programs can be structured in a procedural-orientation using a procedural language such as C,
15 PASCAL, and others. The software components communicate in any of a number of means that are well-known to those skilled in the art, such as application program interfaces (A.P.I.) or interprocess communication techniques such as remote procedure call (R.P.C.), common object request broker architecture (CORBA), Component Object Model (COM), Distributed Component Object Model (DCOM),
20 Distributed System Object Model (DSOM) and Remote Method Invocation (RMI).

Of course it is readily appreciated by those skilled in the art that any programming methodology, programming language, programming interface, operating system, or computing environment, now known or hereafter developed can be readily deployed, without departing from the tenets of the present invention
25 and all such implementation specific embodiments are intended to fall within the broad scope of the present invention.

Conclusion

In summary, disclosed is a hand-held portable electronic device including a housing, a processor located within the housing, a memory in communication with the processor, and a display in communication with the processor. The display is positioned near the surface of the housing. A touch panel is placed over the display and is mounted to an opening within the housing. The touch panel is in communication with the processor and positioned on a surface of the housing. The electronic device can include a component for performing a first function, and a component for performing a second function.

At least one of the first and the second components includes one or more sub-components adapted to perform a navigational function. In the invention, the one or more sub-components include hardware and software for performing a triangulation positioning functionality and a dead reckoning positioning functionality. In one embodiment, the triangulation positioning functionality includes a GPS patch antenna mounted in the housing above the display and communicatively coupled to a GPS receiver for providing GPS positioning service. Likewise, the dead reckoning positioning functionality can include a rate gyro. In this manner, the dead reckoning positioning functionality is available to complement and/or supplement the GPS positioning in the event one or more GPS satellite signals are degraded, obstructed, interfered with, or otherwise interrupted. The portable, hand-held, electronic device is also capable of performing other navigational functions, such as performing route calculations and finding points of interest.

The housing includes a flange around the opening which has a fluid seal to prevent fluid flow past the touch panel and into the housing. A shock mount may also be included within the housing to make the touch panel drop-resistant.

Although specific embodiments have been illustrated and described herein, it will be appreciated by those of ordinary skill in the art that any arrangement which is

calculated to achieve the same purpose may be substituted for the specific embodiment shown. This application is intended to cover any adaptations or variations of the present invention. It is to be understood that the above description is intended to be illustrative, and not restrictive. Combinations of the above
5 embodiments, and other embodiments will be apparent to those of skill in the art upon reviewing the above description. The scope of the invention includes any other applications in which the above systems, devices, functional data, and methods are used. The scope of the invention should be determined with reference to the appended claims, along with the full scope of equivalents to which such claims are
10 entitled.
